JointFill FP

Self levelling filler for waterproofing formed or saw-cut joints in concrete slabs

Description
JointFill FP is a blend of cements, fly ash and microsilica with crystalline waterproofing, flow aids and polymers. JointFill FP is mixed with **FlexiPol** liquid polymer to produce a free flowing slurry to be poured into joints in concrete.

Features
JointFill FP is designed to harden in joints, bond well and resist traffic. The polymers ensure self-curing and cohesion of the cured material.

Installation
Joints to be filled must be clear of debris, dust or contaminant that would prevent full depth filling. Wash out the joint with water and allow the concrete to soak. Masking tape should be applied to each side of the joint, to provide a clean edge when stripped.

Mix the components of the kit by slowly adding the powder to the liquid whilst stirring to prevent lumps from forming. Use a jug with a suitable pouring spout to pour the mixture into the joint. Agitation with a putty knife or similar tool will assist complete filling of the joint.

Allow the filler to take an initial set then remove the masking tape and cut off any excess filler with a scraper. If desired the joint may then be tooled with a standard jointing tool, wetted to provide a smooth finish.

Protect the filled joint from wind, sun and rain over night or until the **JointFill FP** is fully set.

Packaging and Yield
JointFill FP is supplied as a kit of 5kg powder and 1 L liquid which yields about 3.5 litres of slurry.

Shelf Life
Stored in cool, dry conditions, one year from date of manufacture.
